

The ELIMINEX Termite Bait System Features:

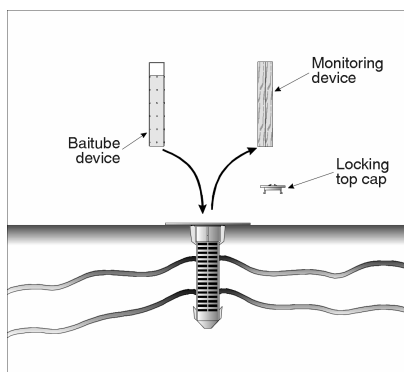

Our system features the Advance Termite Bait Station from Whitmire Micro-Gen. This station has the biggest load of termite bait compared to all the other bait systems on the market today. The system offers inspection that does not disturb termites, a factor that greatly improves our ability to control termites.

Compare our system to a popular termite bait system - Sentricon, from Dow AgroSciences. You'll see why we chose to offer you the 1st Choice system. Simply put: It's a better system, and it's less expensive, too.

The Sentricon System uses an electronic "Scanner" to record station checks. A neat feature, but it's not necessary to control termites, and an expensive tool. They also give computer generated reports. Again, not necessary for termite control. One reason they charge so much more - to pay for unnecessary electronics and software. Did you want termite control or fancy gadgets?

When the station is opened and checked, they must remove the monitor sticks. This disturbs the termites, and can actually cause termites to abandon feeding in that area, thereby reducing their ability to control or eliminate the termites attacking your home. Even with the new ESP system, stations must be opened to verify the presence of termites and apply bait tubes. Too much disturbance = no termite feeding activity.

Once again, when bait is applied into the station, termites are disturbed. They are physically removed from the wood monitor sticks and shaken into the bait tube. Again, termites can abandon the area and never come back. And, if the technician doesn't apply some water into the bait tube, it can dry out and kill those termites, and the system will fail.

Why are they so insistent on disturbing those termites? It doesn't do much for controlling them.

Now, look at the features of our ELIMINEX Termite Bait System. The advantages are clear, once you know what to look for.

Termite Inspection Cartridge

Termites enter from the bottom, and stay in the cartridge when removed and replaced with the Termite Bait Cartridge. No disturbance of termites - no abandoning the bait station.

Termite Monitor Base

The actual wood monitor that starts termites feeding stays in place. Termites are not disturbed, and freely travel up into the Bait Cartridge when inserted.

Termite Bait Cartridge (TBC): This cartridge replaces the Termite Inspection Cartridge when termites become active in the station. The TBC contains 3 times the amount of bait that Sentricon bait tubes have. That means more bait is available to eliminate the termites quicker. The active ingredient - Diflubenzuron - is an Insect Growth Regulator, just like Sentricon uses, so it's just as effective. We can also apply "Above Ground Bait" if needed.

Our system was designed around all the good things that termite bait systems offer, while at the same time eliminating the negative issues that affect termite bait system performance and cost.

No Expensive, Unnecessary Electronics or Software: That means less cost for us, and we can pass that on to you. Why pay for something that you don't need to have to kill termites. That's what you want isn't it - eliminate the termites?

No Disturbance Of Termites: That means termites aren't inclined to abandon the station, so they keep on feeding. Keeping the termites feeding in the stations is VERY CRITICAL to eliminating them from your home.

Bigger Bait Load: That means more bait is available for termites to eat, which means faster control. What happens if termites run out of bait to eat? They leave. Our system uses a 2-Stage system, insuring plenty of food. A bigger bait load also means less frequent visits, which in turn means:

Less Expense: Write down what they want for a Sentricon system below, then compare it to our cost. Then you'll CLEARLY see the big difference.

Sentricon Price: \$ _____ ELIMINEX Price: \$ _____
